

Swift Eats

<https://github.com/chelseybergmann/SwiftEats/tree/Main>

Purpose:

Swift Eats is a food delivery service. This app opens with a table of restaurants to be selected. The user chooses a side, entree, and drink from a drop down menu. Then, a receipt of their order is shown on the screen.

What's interesting about it:

The user has three restaurants to choose from and three options for each food item. There is a back button to select a new restaurant as well as a checkout button. When the checkout is pressed, the program sends the user's selected info to a receipt for its summary. The summary shows what the user ordered, their total, and which restaurant they ordered from.
